

Energy-efficient Product Application

Energy Recovery

The surplus electricity generated in the process of product production and testing is returned to the grid to reduce carbon emissions and reduce energy consumption costs.

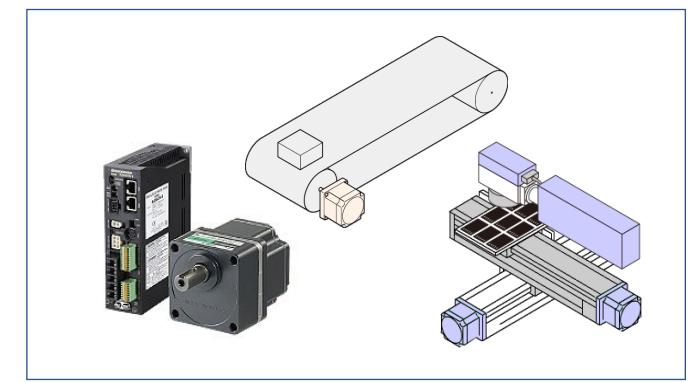

Centralized Power Supply

Centralized power management, improve power utilization and system reliability, reduce energy consumption and environmental pollution, and realize energy interconnection and intelligent management.

Driving System

Servo driver is a controller used to control servo motors, which achieves high-precision positioning of the transmission system by controlling the servo motor through three methods: position, speed, and torque.
